

Classical Field Theory II

Lecture Notes

Symmetry breaking, topology, gravity, constraints, and effective viewpoints.

June 13, 2026

Contents

Preface	1
I Symmetry Breaking, Topology, and Nonlinear Fields	2
1 Spontaneous Symmetry Breaking in Classical Field Theory	3
1.1 Symmetry of the Action vs Symmetry of the Vacuum	3
1.2 Degenerate Minima of the Potential	3
1.3 Small Fluctuations Around a Vacuum	3
1.4 Goldstone Modes	3
1.5 Mexican-Hat Potential	3
1.6 Global Symmetry Breaking	3
1.7 Local Symmetry Breaking	3
1.8 Abelian Higgs Model	3
1.9 Classical Higgs Mechanism	3
1.10 Mass Generation for Gauge Fields	3
1.11 What Is and Is Not “Broken”?	3
2 Solitons, Instantons, and Topological Defects	4
2.1 Nonlinear Field Equations	4
2.2 Finite-Energy Boundary Conditions	4
2.3 Topological Sectors	4
2.4 Kinks in 1 + 1 Dimensions	4
2.5 Sine-Gordon Model	4
2.6 Vortices in the Abelian Higgs Model	4
2.7 Magnetic Monopoles	4
2.8 Skyrmions	4
2.9 Instantons: Classical Solutions in Euclidean Field Theory	4
2.10 Bogomolny Bounds and BPS Equations	4
2.11 Stability from Topology	4
2.12 Physical Meaning of Topological Charge	4
3 Classical Field Theory at Finite Temperature and in Media	5
3.1 Effective Classical Fields	5
3.2 Order Parameters	5
3.3 Landau Theory of Phase Transitions	5
3.4 Ginzburg–Landau Functional	5
3.5 Correlation Length	5
3.6 Mean-Field Approximation	5
3.7 Linear Response	5
3.8 Fields in Continuous Media	5
3.9 Hydrodynamic Fields	5
3.10 Elastic Fields	5
3.11 Classical Field Theory Beyond Fundamental Interactions	5

II	Geometry and Gravity as Field Theory	6
4	Classical Field Theory on Curved Spacetime	7
4.1	Why Curved Backgrounds Matter	7
4.2	Manifolds, Metrics, and Covariant Derivatives	7
4.3	Scalar Fields on Curved Spacetime	7
4.4	Electromagnetic Fields on Curved Spacetime	7
4.5	Stress-Energy Tensor from Metric Variation	7
4.6	Conservation Law $\nabla_\mu T^{\mu\nu} = 0$	7
4.7	Minimal and Non-Minimal Coupling	7
4.8	Conformal Coupling of Scalar Fields	7
4.9	Background vs Dynamical Geometry	7
4.10	Physical Meaning of Covariance	7
5	General Relativity as a Classical Field Theory	8
5.1	Metric as a Dynamical Field	8
5.2	Einstein–Hilbert Action	8
5.3	Variation of the Metric	8
5.4	Boundary Terms and the Gibbons–Hawking–York Term	8
5.5	Einstein Field Equations	8
5.6	Stress-Energy Tensor as Source	8
5.7	Diffeomorphism Invariance	8
5.8	Bianchi Identity and Energy-Momentum Conservation	8
5.9	Linearized Gravity	8
5.10	Gravitational Waves	8
5.11	Gauge Symmetry in Linearized Gravity	8
5.12	Comparison with Yang–Mills Theory	8
5.13	Why Gravity Is Special	8
6	First-Order and Geometric Formulations	9
6.1	Vielbein Formalism	9
6.2	Spin Connection	9
6.3	Torsion and Curvature	9
6.4	Palatini Action	9
6.5	Einstein–Cartan Theory	9
6.6	Differential Forms in Gravity	9
6.7	BF Theory as a Topological Field Theory	9
6.8	Constrained BF Theory and Gravity	9
6.9	Topological Terms: Euler, Pontryagin, Nieh–Yan	9
6.10	Boundary Degrees of Freedom and Charges	9
6.11	Classical Geometry as Gauge-Like Field Theory	9
III	Constraints, Boundaries, and Charges	10
7	Gauge Theories as Constrained Systems	11
7.1	Redundancy vs Physical Symmetry	11
7.2	Constraints in Electromagnetism	11
7.3	Gauss Law as a Constraint	11
7.4	First-Class Constraints	11
7.5	Gauge Orbits	11
7.6	Physical Phase Space	11

7.7	Gauge Fixing	11
7.8	Residual Gauge Symmetries	11
7.9	Observables in Gauge Theory	11
7.10	Dirac Brackets: Conceptual Introduction	11
7.11	Why Gauge Theory Is Not Just “Symmetry”	11
8	Boundaries, Surface Terms, and Conserved Charges	12
8.1	Why Boundary Terms Matter	12
8.2	Variation of the Action with Boundaries	12
8.3	Boundary Conditions	12
8.4	Surface Charges in Electromagnetism	12
8.5	Surface Charges in Yang–Mills Theory	12
8.6	Surface Charges in Gravity	12
8.7	Asymptotic Symmetries	12
8.8	Local Symmetries Becoming Physical at the Boundary	12
8.9	Hamiltonian Generators and Boundary Contributions	12
8.10	Corner Terms and Edge Modes	12
8.11	Physical Interpretation of Charges	12
9	Covariant Phase Space	13
9.1	Space of Solutions	13
9.2	Symplectic Potential Current	13
9.3	Symplectic Current	13
9.4	Presymplectic Form	13
9.5	Degeneracy Directions and Gauge Transformations	13
9.6	Noether Current in Covariant Language	13
9.7	Noether Charge Form	13
9.8	Hamiltonian Charges	13
9.9	Integrability of Charges	13
9.10	Fluxes Through Boundaries	13
9.11	Examples: Scalar Field, Maxwell Theory, Gravity	13
9.12	Why Covariant Phase Space Is Useful	13
IV	Classical Field Theory as Preparation for Quantum Field Theory	14
10	Linearization, Normal Modes, and Quantization Readiness	15
10.1	Linearization Around a Classical Solution	15
10.2	Normal Modes of a Field	15
10.3	Fourier Decomposition	15
10.4	Harmonic Oscillators Hidden in Free Fields	15
10.5	Classical Phase Space of Modes	15
10.6	Positive and Negative Frequency Solutions	15
10.7	Green’s Functions Revisited	15
10.8	Propagators as Classical Response Functions	15
10.9	From Classical Modes to Quantum Particles	15
10.10	What Changes Under Quantization?	15
11	Effective Field Theory Viewpoint	16
11.1	Classical Field Theory and Scales	16
11.2	Relevant, Marginal, and Irrelevant Terms: Classical Intuition	16
11.3	Symmetry as an Organizing Principle	16

11.4	Derivative Expansion	16
11.5	Effective Actions	16
11.6	Integrating Out Heavy Classical Fields: A Toy Model	16
11.7	Naturalness as a Classical Question	16
11.8	Limits of Validity of a Field Theory	16
11.9	Why the Same Field Can Have Different Effective Descriptions	16
12	Summary: The Architecture of Classical Field Theory	17
12.1	Fields, Actions, and Equations of Motion	17
12.2	Symmetries and Conservation Laws	17
12.3	Gauge Redundancy and Constraints	17
12.4	Local Dynamics and Boundary Charges	17
12.5	Linear and Nonlinear Phenomena	17
12.6	Geometry as Field Theory	17
12.7	Classical Field Theory as the Language of Modern Theoretical Physics	17
12.8	Conceptual Map Toward Quantum Field Theory, General Relativity, and Beyond	17
A	Notation and Conventions	18
A.1	Metric Signatures	18
A.2	Index Conventions	18
A.3	Units and Dimensions	18
A.4	Fourier Transform Conventions	18
A.5	Levi-Civita Symbols and Tensors	18
A.6	Differential Form Conventions	18
A.7	Gamma Matrix Conventions	18
B	Variational Calculus for Fields	19
B.1	Variation of a Functional	19
B.2	Integration by Parts	19
B.3	Boundary Terms	19
B.4	Functional Derivatives	19
B.5	Variation with Constraints	19
B.6	Variation with Respect to the Metric	19
B.7	Common Variational Identities	19
C	Lie Groups and Lie Algebras	20
C.1	Groups, Algebras, and Generators	20
C.2	Structure Constants	20
C.3	Representations	20
C.4	Adjoint Representation	20
C.5	Exponential Map	20
C.6	Gauge Transformations	20
C.7	Examples: $U(1)$, $SU(2)$, $SU(3)$, $SO(3)$, $SO(1, 3)$	20
D	Differential Forms and Geometry	21
D.1	Forms and Exterior Derivative	21
D.2	Wedge Product	21
D.3	Hodge Dual	21
D.4	Stokes' Theorem	21
D.5	Connections and Curvature	21
D.6	Bianchi Identities	21
D.7	Applications to Maxwell and Yang–Mills Theory	21

D.8	Applications to Gravity	21
E	Green's Functions	22
E.1	Green's Functions for Ordinary Differential Equations	22
E.2	Green's Functions for Partial Differential Equations	22
E.3	Retarded, Advanced, and Feynman-Type Green's Functions	22
E.4	Green's Functions for the Wave Equation	22
E.5	Green's Functions for the Klein–Gordon Equation	22
E.6	Physical Interpretation as Response to Sources	22
F	Suggested Problems	23
F.1	Variational Principle	23
F.2	Noether Currents	23
F.3	Scalar Fields	23
F.4	Electromagnetism	23
F.5	Yang–Mills Theory	23
F.6	Spinor Fields	23
F.7	Spontaneous Symmetry Breaking	23
F.8	Solitons	23
F.9	Gravity as Field Theory	23
F.10	Boundaries and Charges	23

Preface

Classical Field Theory II continues the first course after the basic Lagrangian, Hamiltonian, symmetry, and fundamental-field examples have been introduced. The emphasis now shifts toward nonlinear phenomena, topology, gravity, boundary charges, constraints, and the conceptual preparation for quantum field theory.

Remark

The guiding question of this second course is not only how to derive field equations, but how classical field theories organize phases, defects, geometry, gauge redundancy, boundaries, and effective descriptions.

Part I

Symmetry Breaking, Topology, and Nonlinear Fields

Chapter 1

Spontaneous Symmetry Breaking in Classical Field Theory

- 1.1 Symmetry of the Action vs Symmetry of the Vacuum
- 1.2 Degenerate Minima of the Potential
- 1.3 Small Fluctuations Around a Vacuum
- 1.4 Goldstone Modes
- 1.5 Mexican-Hat Potential
- 1.6 Global Symmetry Breaking
- 1.7 Local Symmetry Breaking
- 1.8 Abelian Higgs Model
- 1.9 Classical Higgs Mechanism
- 1.10 Mass Generation for Gauge Fields
- 1.11 What Is and Is Not “Broken”?

Chapter 2

Solitons, Instantons, and Topological Defects

2.1 Nonlinear Field Equations

2.2 Finite-Energy Boundary Conditions

2.3 Topological Sectors

2.4 Kinks in $1 + 1$ Dimensions

2.5 Sine-Gordon Model

2.6 Vortices in the Abelian Higgs Model

2.7 Magnetic Monopoles

2.8 Skyrmions

2.9 Instantons: Classical Solutions in Euclidean Field Theory

2.10 Bogomolny Bounds and BPS Equations

2.11 Stability from Topology

2.12 Physical Meaning of Topological Charge

Chapter 3

Classical Field Theory at Finite Temperature and in Media

3.1 Effective Classical Fields

3.2 Order Parameters

3.3 Landau Theory of Phase Transitions

3.4 Ginzburg–Landau Functional

3.5 Correlation Length

3.6 Mean-Field Approximation

3.7 Linear Response

3.8 Fields in Continuous Media

3.9 Hydrodynamic Fields

3.10 Elastic Fields

3.11 Classical Field Theory Beyond Fundamental Interactions

Part II

Geometry and Gravity as Field Theory

Chapter 4

Classical Field Theory on Curved Spacetime

4.1 Why Curved Backgrounds Matter

4.2 Manifolds, Metrics, and Covariant Derivatives

4.3 Scalar Fields on Curved Spacetime

4.4 Electromagnetic Fields on Curved Spacetime

4.5 Stress-Energy Tensor from Metric Variation

4.6 Conservation Law $\nabla_\mu T^{\mu\nu} = 0$

4.7 Minimal and Non-Minimal Coupling

4.8 Conformal Coupling of Scalar Fields

4.9 Background vs Dynamical Geometry

4.10 Physical Meaning of Covariance

Chapter 5

General Relativity as a Classical Field Theory

- 5.1 Metric as a Dynamical Field
- 5.2 Einstein–Hilbert Action
- 5.3 Variation of the Metric
- 5.4 Boundary Terms and the Gibbons–Hawking–York Term
- 5.5 Einstein Field Equations
- 5.6 Stress-Energy Tensor as Source
- 5.7 Diffeomorphism Invariance
- 5.8 Bianchi Identity and Energy-Momentum Conservation
- 5.9 Linearized Gravity
- 5.10 Gravitational Waves
- 5.11 Gauge Symmetry in Linearized Gravity
- 5.12 Comparison with Yang–Mills Theory
- 5.13 Why Gravity Is Special

Chapter 6

First-Order and Geometric Formulations

6.1 Vielbein Formalism

6.2 Spin Connection

6.3 Torsion and Curvature

6.4 Palatini Action

6.5 Einstein–Cartan Theory

6.6 Differential Forms in Gravity

6.7 BF Theory as a Topological Field Theory

6.8 Constrained BF Theory and Gravity

6.9 Topological Terms: Euler, Pontryagin, Nieh–Yan

6.10 Boundary Degrees of Freedom and Charges

6.11 Classical Geometry as Gauge-Like Field Theory

Part III

**Constraints, Boundaries, and
Charges**

Chapter 7

Gauge Theories as Constrained Systems

- 7.1 Redundancy vs Physical Symmetry
- 7.2 Constraints in Electromagnetism
- 7.3 Gauss Law as a Constraint
- 7.4 First-Class Constraints
- 7.5 Gauge Orbits
- 7.6 Physical Phase Space
- 7.7 Gauge Fixing
- 7.8 Residual Gauge Symmetries
- 7.9 Observables in Gauge Theory
- 7.10 Dirac Brackets: Conceptual Introduction
- 7.11 Why Gauge Theory Is Not Just “Symmetry”

Chapter 8

Boundaries, Surface Terms, and Conserved Charges

- 8.1 Why Boundary Terms Matter
- 8.2 Variation of the Action with Boundaries
- 8.3 Boundary Conditions
- 8.4 Surface Charges in Electromagnetism
- 8.5 Surface Charges in Yang–Mills Theory
- 8.6 Surface Charges in Gravity
- 8.7 Asymptotic Symmetries
- 8.8 Local Symmetries Becoming Physical at the Boundary
- 8.9 Hamiltonian Generators and Boundary Contributions
- 8.10 Corner Terms and Edge Modes
- 8.11 Physical Interpretation of Charges

Chapter 9

Covariant Phase Space

9.1 Space of Solutions

9.2 Symplectic Potential Current

9.3 Symplectic Current

9.4 Presymplectic Form

9.5 Degeneracy Directions and Gauge Transformations

9.6 Noether Current in Covariant Language

9.7 Noether Charge Form

9.8 Hamiltonian Charges

9.9 Integrability of Charges

9.10 Fluxes Through Boundaries

9.11 Examples: Scalar Field, Maxwell Theory, Gravity

9.12 Why Covariant Phase Space Is Useful

Part IV

Classical Field Theory as Preparation for Quantum Field Theory

Chapter 10

Linearization, Normal Modes, and Quantization Readiness

10.1 Linearization Around a Classical Solution

10.2 Normal Modes of a Field

10.3 Fourier Decomposition

10.4 Harmonic Oscillators Hidden in Free Fields

10.5 Classical Phase Space of Modes

10.6 Positive and Negative Frequency Solutions

10.7 Green's Functions Revisited

10.8 Propagators as Classical Response Functions

10.9 From Classical Modes to Quantum Particles

10.10 What Changes Under Quantization?

Chapter 11

Effective Field Theory Viewpoint

- 11.1 Classical Field Theory and Scales
- 11.2 Relevant, Marginal, and Irrelevant Terms: Classical Intuition
- 11.3 Symmetry as an Organizing Principle
- 11.4 Derivative Expansion
- 11.5 Effective Actions
- 11.6 Integrating Out Heavy Classical Fields: A Toy Model
- 11.7 Naturalness as a Classical Question
- 11.8 Limits of Validity of a Field Theory
- 11.9 Why the Same Field Can Have Different Effective Descriptions

Chapter 12

Summary: The Architecture of Classical Field Theory

12.1 Fields, Actions, and Equations of Motion

12.2 Symmetries and Conservation Laws

12.3 Gauge Redundancy and Constraints

12.4 Local Dynamics and Boundary Charges

12.5 Linear and Nonlinear Phenomena

12.6 Geometry as Field Theory

12.7 Classical Field Theory as the Language of Modern Theoretical Physics

12.8 Conceptual Map Toward Quantum Field Theory, General Relativity, and Beyond

Appendix A

Notation and Conventions

A.1 Metric Signatures

A.2 Index Conventions

A.3 Units and Dimensions

A.4 Fourier Transform Conventions

A.5 Levi-Civita Symbols and Tensors

A.6 Differential Form Conventions

A.7 Gamma Matrix Conventions

Appendix B

Variational Calculus for Fields

B.1 Variation of a Functional

B.2 Integration by Parts

B.3 Boundary Terms

B.4 Functional Derivatives

B.5 Variation with Constraints

B.6 Variation with Respect to the Metric

B.7 Common Variational Identities

Appendix C

Lie Groups and Lie Algebras

C.1 Groups, Algebras, and Generators

C.2 Structure Constants

C.3 Representations

C.4 Adjoint Representation

C.5 Exponential Map

C.6 Gauge Transformations

C.7 Examples: $U(1)$, $SU(2)$, $SU(3)$, $SO(3)$, $SO(1,3)$

Appendix D

Differential Forms and Geometry

D.1 Forms and Exterior Derivative

D.2 Wedge Product

D.3 Hodge Dual

D.4 Stokes' Theorem

D.5 Connections and Curvature

D.6 Bianchi Identities

D.7 Applications to Maxwell and Yang–Mills Theory

D.8 Applications to Gravity

Appendix E

Green's Functions

E.1 Green's Functions for Ordinary Differential Equations

E.2 Green's Functions for Partial Differential Equations

E.3 Retarded, Advanced, and Feynman-Type Green's Functions

E.4 Green's Functions for the Wave Equation

E.5 Green's Functions for the Klein–Gordon Equation

E.6 Physical Interpretation as Response to Sources

Appendix F

Suggested Problems

F.1 Variational Principle

F.2 Noether Currents

F.3 Scalar Fields

F.4 Electromagnetism

F.5 Yang–Mills Theory

F.6 Spinor Fields

F.7 Spontaneous Symmetry Breaking

F.8 Solitons

F.9 Gravity as Field Theory

F.10 Boundaries and Charges

List of Figures
